Art Unit

2116

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
 - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
 - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 31 October 2005.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-21 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-21 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1. It is hereby acknowledged that the following papers have been received and placed of record in the file: Amendment dated October 31, 2005.
2. Claims 1-21 are presented for examination.

Claim Rejections - 35 USC § 112

3. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

4. Claim 21 is rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. Applicant did not disclose the subject matter of "a counter to determine whether the rising edge of the delayed feedback clock signal is early or late with respect to the falling edge of the feedback clock signal" in the original specification. Therefore, said subject matter is considered new and is not eligible for prosecution. In the interest of compact prosecution, prior art will be applied to the other limitations of the claim.

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Re Claims 1-5, 9-13, 18-20

6. Claims 1-5, 9-13, and 18-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sevalia et al., US Patent 6356122, hereinafter Sevalia, in view of Roiter, US Patent 5636249.
7. In re claim 1, Sevalia discloses a timing circuit [fig.2; col.1, ll.65-66] comprising:
- At least one driving circuit [multiplexer] outputting an output signal [col.3, l.10; col.4, ll.31-32].
 - A phase locked loop [conventional PLL] receiving a reference clock signal [ref clock from input pin] and a delayed feedback clock signal [feedback signal from multiplexer is delayed by DL2], and supplying an output clock signal [signal from post divider M] to said at least one driving circuit, said phase locked loop generating said output clock signal according to said received reference clock signal and delayed feedback clock signal [fig.2; col.1, ll.56-64].
 - First and second delay elements [programmable delays DL1 and DL2] located in the path of said reference clock signal and the path of a feedback clock signal, respectively, said second delay element to delay the feedback clock signal [fig.2; col.3, ll.12-24, ll.30-39; DL2 configured to provide a delay in order to make said output signal meet a predetermined valid data timing requirement], to determine whether an edge of the delayed feedback clock signal is early or late with respect to an edge of the feedback clock signal [col.2, l.45 – col.3, l.2; difference between an edge of input feedback signal into DL2 and a corresponding edge of output delayed feedback signal from DL2 constitutes the delay to be adjusted in order to

Art Unit: 2116

provide a predictable input-output delay], and to increase or decrease the delay of the feedback clock signal based on whether an edge of the delayed feedback clock signal is early or late with respect to an edge of the feedback clock signal [col.4, ll.37-49; control DL2 accordingly to provide a predictable input-output delay].

8. Sevalia did not discuss the details of the delay elements.

9. Roiter discloses a timing circuit [phase synchronization apparatus] comprising:

- Delay elements [fig.2] to determine whether a rising edge of a signal [rds signal] is early or late with respect to a falling edge of a clock signal [bit rate clock] [fig.3; col.4, l.65 – col.5, l.29].

10. It would have been obvious to one of ordinary skill in the art, having the teachings of Sevalia and Roiter before him at the time the invention was made, to modify the timing circuit taught by Sevalia to include the teachings of Roiter [broad concept can be applied to all kinds of signals in general], in order to obtain the timing circuit comprising delay elements to determine whether a rising edge of the delayed feedback clock signal is early or late with respect to a falling edge of the feedback clock signal, and to increase or decrease the delay of the feedback clock signal based on whether the rising edge of the delayed feedback clock signal is early or late with respect to the falling edge of the feedback clock signal. One of ordinary skill in the art would have been motivated to make such a combination as it provides a way to align the edges of signals [Roiter: col.4, l.65 – col.5, l.29].

11. As to claims 2 and 10, Sevalia discloses the delay elements [programmable delays DL1 and DL2] that are located only in the reference clock and feedback clock paths [fig.2].

Art Unit: 2116

12. As to claims 3 and 11, Sevalia discloses the first and second delay elements that are self-calibrating delay cells [col.4, ll.5-17, ll.39-40, l.50; one time programming of estimated delay subsequently lets delay circuits to calibrate or tune accordingly to be in phase].

13. As to claims 4, 12 and 19, Sevalia discloses the self-calibrating delay cells that calibrate themselves to meet specified timing adjustment, granularity and/or range [col.3, ll.40-63; col.4, ll.5-17, ll.39-40, l.50; transistors and other elements have rated performance specifications that are selected to be within a tolerable range for timing adjustment].

14. As to claims 5, 13, and 20, Sevalia discloses the self-calibrating delay cells that use a digital compensation technique to reduce PVT variations [col.3, ll.52-59; col.4, ll.17-20, ll.45-54; configuration bits digitally set values to compensate for PVT variations, taking into account the PVT characteristics of the delay elements].

15. In re claim 9, Sevalia and Roiter disclose each and every limitation of the claim as discussed above in reference to claim 1. In addition, Sevalia discloses an I/O circuit [col.1, ll.56-59] comprising:

- A transmitting device [fig.2] outputting at least one output signal [multiplexer outputs one signal], said transmitting device having:
 - At least one driving circuit [multiplexer], the number of driving circuits corresponding to the number of output signals [fig.2; col.3, l.10; col.4, ll.31-32].
- A receiving device [col.2, ll.19-25] receiving said at least one output signal from said transmitting device, the timing of said received at least one output signal

Art Unit: 2116

meeting said predetermined valid timing requirement [col.4, ll.17-20; configuration set up for device to get in phase signals in order to operate correctly].

16. In re claim 18, Sevalia discloses a method of transferring a signal from a transmitting device [fig.2] to a receiving device [col.2, ll.19-25; circuit of fig.2 transmits clock signal to the device that the configurations are set to ensure timing is in phase] comprising:

- Outputting said signal from said transmitting device using a driving circuit [multiplexer] [col.3, l.10; col.4, ll.31-32].
- Receiving a reference clock signal in said transmitting device [fig.2; ref clock from input pin].
- Generating an output clock signal according to said received reference clock signal and a delayed feedback clock signal in a phase locked loop [conventional PLL; col.1, ll.56-64].
- Providing a delay in a path of said reference clock signal and a path of said feedback clock signal [programmable delay DL1 and DL2], said delay being configured to make said at least one output signal meet a predetermined valid data timing requirement [col.3, ll.12-24, ll.30-39, l.64 -- col.4, l.27; output is in phase with input for data timing to be valid].

17. Sevalia did not discuss the details of the delay elements.

18. Roiter discloses a method comprising:

- Phase aligning a falling edge of a signal [bit rate clock] to a rising edge of another signal [rds signal] [fig.3; col.4, l.65 – col.5, l.29].

Art Unit: 2116

19. It would have been obvious to one of ordinary skill in the art, having the teachings of Sevalia and Roiter before him at the time the invention was made, to modify the timing circuit taught by Sevalia to include the teachings of Roiter, in order to obtain the method comprising providing a delay in a path of the reference clock signal and a path of the feedback clock signal, the delay phase-aligning a falling edge of the feedback clock signal to a rising edge of the delayed feedback clock signal to make said at least one output signal meet a predetermined valid data timing requirement. One of ordinary skill in the art would have been motivated to make such a combination as it provides a way to align the edges of signals [Roiter: col.4, l.65 – col.5, l.29].

Re Claims 6, 14

20. Claims 6 and 14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sevalia and Roiter as applied to claims 5 and 13 above, and further in view of Hamza, U.S. Patent 5818270.

21. Hamza was cited as prior art in the previous Office Action.

22. In re claims 6 and 14, Sevalia and Roiter disclose every limitation of the claim as discussed above in reference to claims 5 and 13. Sevalia and Roiter did not discuss utilizing a multi-tap delay buffer to delay a clock signal.

23. Hamza discloses a timing circuit [clock multiplier 10] that utilizes a multi-tap delay buffer [logical multiplier 14] in the clock signal [waveform 13] path to delay the clock signal, the amount of delay being controlled by selecting a tap of the multi-tap delay buffer [col.2, ll.41-60].

24. It would have been obvious to one of ordinary skill in the art, having the teachings of Savalia, Roiter and Hamza before him at the time the invention was made, to modify

Art Unit: 2116

the timing circuit taught by Savalia and Roiter to include the multi-tap delay buffer as taught by Hamza, in order to obtain the timing circuit wherein the digital compensation technique utilizes a multi-tap delay buffer in the feedback clock signal path to delay the feedback clock signal with the amount of delay being controlled by selecting a tap of the multi-tap delay buffer. One of ordinary skill in the art would have been motivated to make such a combination as it provides a way to contribute to the reduction of power and PVT variations [particularly the temperature] [Hamza: col.1, ll.37-39].

Re Claims 7-8, 15

25. Claims 7-8 and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sevalia and Roiter as applied to claim 1 above, and further in view of Byrn et al., U.S. Patent 5977837, hereinafter Byrn.

26. Byrn was cited as prior art in the previous Office Action.

27. In re claims 7 and 15, Sevalia and Roiter disclose every limitation of the claim as discussed above in reference to claim 1. Sevalia and Roiter did not discuss the timing circuit comprising a plurality of driving circuits.

28. Byrn discloses a timing circuit [phase selector circuit 200] comprising a plurality of driving circuits [external frequency dividers 204, 206, and 208] and a phase locked loop [202] providing an output clock signal [PLL out] to all of the plurality of driving circuits [fig.2; col.2, ll.54-62].

29. It would have been obvious to one of ordinary skill in the art, having the teachings of Savalia, Roiter and Byrn before him at the time the invention was made, to modify the timing circuit taught by Sevalia and Roiter to include the plurality of driving circuits as taught by Byrn, in order to obtain the timing circuit with the plurality of driving circuits

Art Unit: 2116

for outputting a plurality of clock signals. One of ordinary skill in the art would have been motivated to make such a combination as it provides a way to output a plurality of clock signals.

30. As to claim 8, Byrn discloses the plurality of driving circuits that drive respective output signals from an IC chip [CMOS microprocessor] [col.1, ll.15-18; external is relative to the synchronization path].

Re Claims 16-17

31. Claims 16-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sevalia and Roiter as applied to claim 9 above, and further in view of Goldrian, U.S. Patent 5742798.

32. Goldrian was cited as prior art in the previous Office Action.

33. In re claim 16, Sevalia and Roiter disclose every limitation of the claim as discussed above in reference to claim 9. Sevalia and Roiter did not disclose expressly the I/O circuit operating with a bus.

34. Goldrian discloses an I/O circuit [fig.2] wherein the transmitting device [clock generator 200] and the receiving device [chip-A 204] comprise IC chips and the output signals [201] are driven on a bus [bus comprises of lines 201-203] between the IC chips [col.3, ll.27-54].

35. It would have been obvious to one of ordinary skill in the art, having the teachings of Sevalia, Roiter and Goldrian before him at the time the invention was made, to use the IC chip-bus setting as taught by Goldrian for the I/O circuit disclosed by Sevalia and Roiter as the setting taught by Goldrian is suitable for use with the I/O circuit of Sevalia

Art Unit: 2116

and Roiter. One of ordinary skill in the art would have been motivated to make such a combination as it provides a way to increase processing efficiency [col.1, ll.14-28].

36. As to claim 17, Goldrian discloses the transmitting device and the receiving device are mounted at a distance from each other on a printed circuit board [col.1, l.11].

Re Claim 21

37. Claim 21 is rejected under 35 U.S.C. 103(a) as being unpatentable over Sevalia and in view of Roiter and Kriz et al., U.S. Patent 6259295, hereinafter Kriz.

38. Sevalia discloses an integrated circuit [fig.2; col.1, ll.65-66], comprising

- A first delay element [DL1] located in the path of a reference clock signal [fig.2].
- A second delay element [DL2] located in the path of a feedback clock signal, the second delay element to produce a delayed feedback clock signal [fig.2; col.3, ll.12-24, ll.30-39; DL2 configured to provide a delay in order to make said output signal meet a predetermined valid data timing requirement].
- A phase detector to phase-align an edge of the feedback clock signal to an edge of the delayed feedback clock signal [col.2, l.45 – col.3, l.2; difference between an edge of input feedback signal into DL2 and a corresponding edge of output delayed feedback signal from DL2 constitutes the delay to be adjusted in order to provide a predictable input-output delay].
- A counter to determine whether an edge of the delayed feedback clock signal is early or late with respect to an edge of the feedback clock signal [col.2, l.45 – col.3, l.2; col.3, ll.39; feedback counter provides adjustment for difference between an edge of input feedback signal into DL2 and a corresponding edge of

Art Unit: 2116

output delayed feedback signal from DL2 in order to provide a predictable input-output delay].

39. Sevalia did not discuss the details of the delay elements and an associated DAC.

40. Kris discloses a DAC [28] to cause a delay [via vbias] of a second delay element [delay cell] to increase if a clock signal is early with respect to an edge of the clock signal, the DAC to cause the delay of the second delay element to decrease if the clock signal is late with respect to the edge of the clock signal [col.2, ll.13-45].

41. It would have been obvious to one of ordinary skill in the art, having the teachings of Sevalia and Kris before him at the time the invention was made, to modify the integrated circuit taught by Sevalia to include the teachings of Kris, in order to obtain the integrated circuit comprising the well-known DAC to cause a delay of the second delay element to increase if the delayed feedback clock signal is early with respect to an edge of the feedback clock signal and vice versa. One of ordinary skill in the art would have been motivated to make such a combination as it provides a way to better adjust delay elements beyond conventional intrinsic delays [Kris: col.1, ll.51-63].

42. Roiter discloses a phase detector [fig.2] to phase align a falling edge of a clock signal [bit rate clock] to a rising edge of a clock signal [rds signal] [fig.3; col.4, l.65 – col.5, l.29].

43. It would have been obvious to one of ordinary skill in the art, having the teachings of Kris, Sevalia and Roiter before him at the time the invention was made, to modify the timing circuit taught by Kris and Sevalia to include the teachings of Roiter [broad concept can be applied to all kinds of signals in general], in order to obtain the claimed integrated circuit. One of ordinary skill in the art would have been motivated to make

Art Unit: 2116

such a combination as it provides a way to align the edges of signals [Roiter: col.4, 1.65 – col.5, 1.29].

Response to Arguments

44. Applicant's arguments filed October 31, 2005 have been fully considered but they are not persuasive. Applicant's arguments do not comply with 37 CFR 1.111(c) because they do not clearly point out the patentable novelty which he or she thinks the claims present in view of the state of the art disclosed by the references cited or the objections made.

45. Applicant's arguments with respect to claim 21 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

46. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.
